

Part 1

Introduction to Django

VERSION: 4.0.1

WRITTEN AND DESIGN BY: BABAR ALI

What is Django?

- ✓ Django is a web application framework written in Python programming language.
- ✓ The Django is very demanding due to its rapid development feature. It takes less time to build application after collecting client requirement.
- ✓ By using Django, we can build web applications in very less time. Django is designed in such a manner that it handles much of configure things automatically, so we can focus on application development only.

Popularity Of Django

Instagram in Django

Mozilla Browser in Django

Pinterest in Django

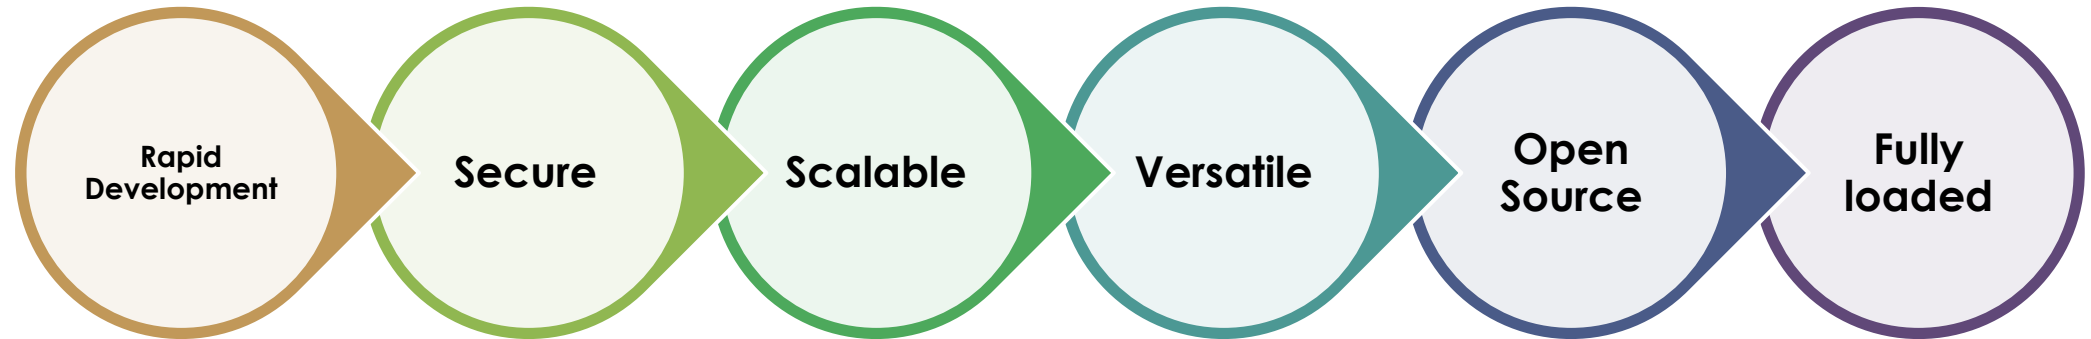

Bit Bucket in Django

The Washington Time in Django

Feature Of Django

How to download Python?

Before download the download you must download the Python in your PC.

Go to Official website of Python download it and Install in your pc:

www.python.org

Check if Python install in your PC or Laptop write in CMD.

shell

```
>>> python --version
```

Check the version of Python

```
>>> python
```

Enter the Python Shell

What is PIP?

- ✓ Pip is a package manager system which is used to install and manage packages written in Python. For Python 3.4 and higher versions **pip** is used to manage packages.
- ✓ Django requires **pip** to start installation.
- To check **PIP** install in your PC or not write the following command in **CMD**.

shell

```
>>> pip --version
```

Check the version of PIP

```
>>> python --version
```

Check the version of Python

Some Basic command in CMD

shell

<pre>>>> cd desktop</pre>	→	Go to Desktop "cd" means current director
<pre>>>> mkdir personal</pre>	→	Create a Folder name "personal"
<pre>>>> cd personal</pre>	→	Go to personal folder
<pre>>>> dir</pre>	→	Show all the director with current directory
<pre>>>> cd ..</pre>	→	Go Back for one folder

How to Download / Install Django in Windows?

- ✓ Django can be installed easily using **pip**.
- ✓ In the command prompt, execute the following command: **pip install Django**.

This will download and install Django.

shell

```
>>> pip install django
```

Download Django in this command

```
>>> django-admin --version
```

Check the version of Django or check if Django install in your PC or not.

Setup a Django Project

- ✓ After you've successfully installed Django, you're ready to create the scaffolding for your new web application. The Django framework distinguishes between **projects** and **apps**.

1) A Django project

- Django project is a high-level unit of organization that contains logic that governs your whole web application. Each project can contain multiple apps.

2) A Django app

- Django app is a lower-level unit of your web application. You can have zero to many apps in a project, and you'll usually have at least one app.

Create Your First Django Project

- ✓ With your virtual environment set up and activated and Django installed, you can now create a project. To create Django project write the following command.

shell

```
>>> django-admin startproject < your project name >
```

```
# Example to create project
```

```
>>> django-admin startproject my_site
```

How to Run Django project in Windows?

- ✓ Access your project folder using “**cd**”.
- ✓ To run or activate Django project in windows run the following command.

shell

// Access Django project Folder

>>> cd my_site

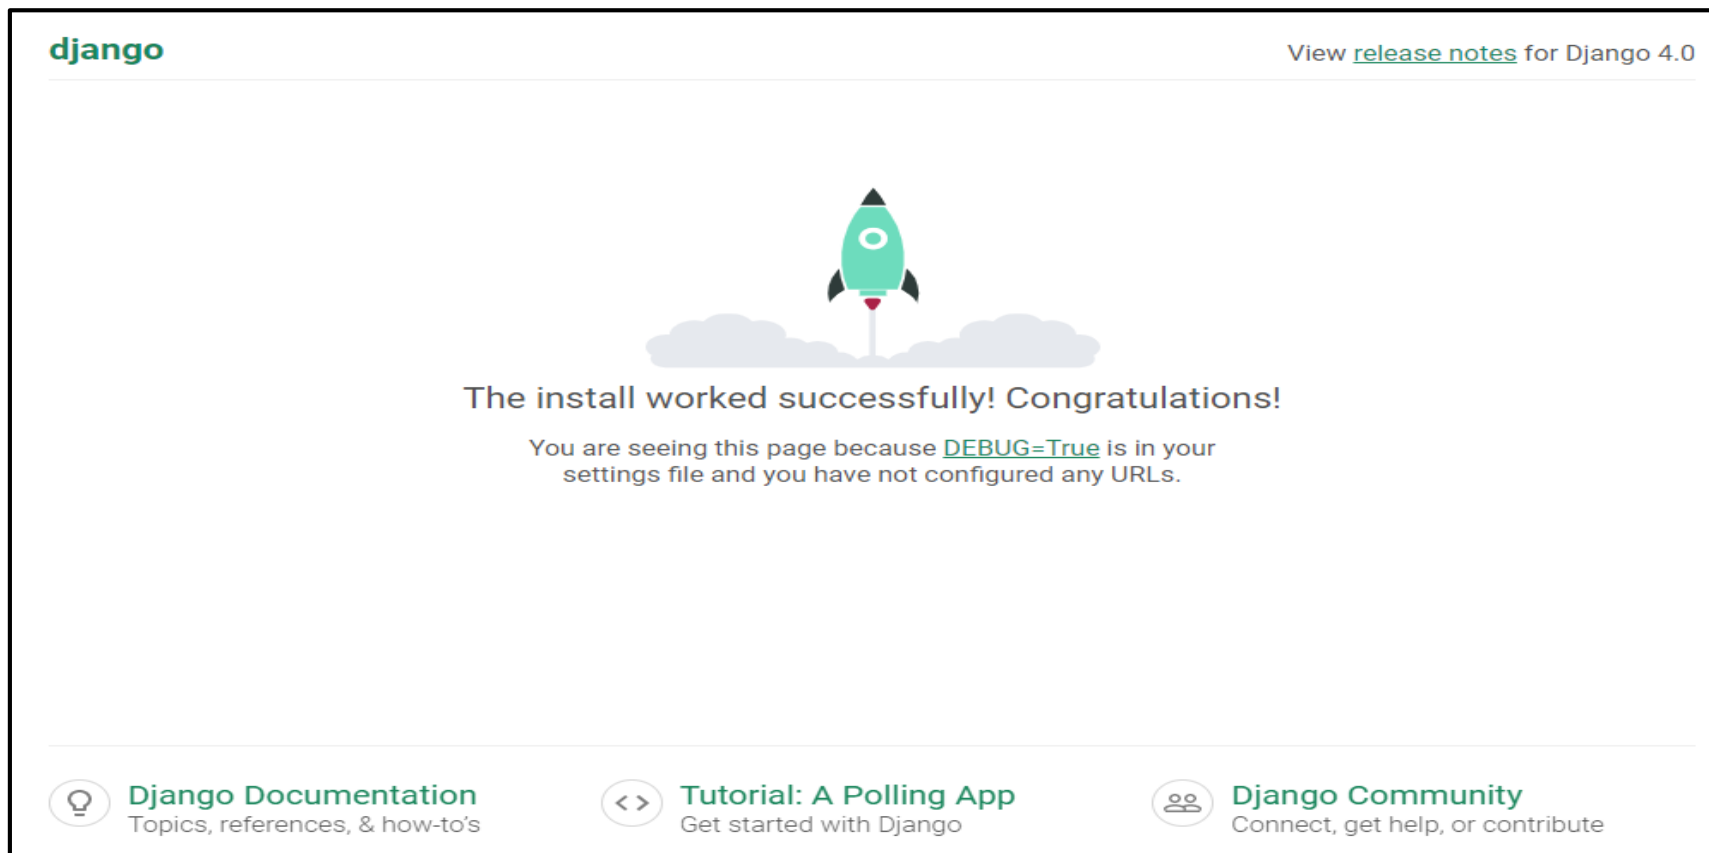

Go to the my_site folder

// Run the Django Project

>>> python manage.py runserver

Run the Django Project

How your Project looks Like?
